Abstract

Makeup products, body care products and fragrance can cause skin disorders such as contact dermatitis. To identify the cause, patch testing is most useful. Based on results of the test, we can advise patients to avoid the causative products and provide daily life guidance.

Here, we will provide 6 cases of contact dermatitis to makeup products, body care products and fragrance.

Case 1: Allergic contact dermatitis due to the ethylhexyl methoxycinnamate of sunscreen base.

Case 2: Allergic contact dermatitis due to the diisostearyl malate of lipstick.

Case 3: Semiopen patch test was positive for mascara and mascara remover, but the patch testing of the ingredients could not be performed.

Case 4: Allergic contact dermatitis due to the cetanol of the hand cream.

Case 5: Irritant contact dermatitis due to the body soap.

Case 6: Photoallergic contact dermatitis due to the perfume.

Key words: contact dermatitis, patch test, makeup products, body care products, fragrance.
